# nullifAI

- **7z container** instead of PyTorch's zip — the scanner opens it, does not recognise it, and now what?
- Payload at the **head** of a deliberately broken pickle stream
- It executes, **then** deserialisation hits the damage

Protocol 2 only. Newer protocols frame the stream and read it whole before executing — truncating it kills your payload instead. I tested it both ways.

# AI VILLAGE

— IDEAS // RESEARCH // REAL IMPACT

haxrbyte@ai-village:~\$

// THE TRICK

# Break the file on purpose.

Payload at the **head** of the stream. Then remove the  
STOP opcode so it will not parse.

// CVE-2023-48022 · UNAUTHENTICATED RCE VIA RAY'S JOBS API
```

# ShadowRay

- The interesting part isn't the bug. It's the **paperwork**.
- **Disputed**. Never directly fixed. Running code *is* the product, so requiring auth was called a deployment decision.
- Five scanners — pip-audit, Trivy, gype, osv-scanner, safety. **All five report it.**  
*Not one can fix it. Fix column empty — and the highest EPSS on the list, 99th percentile.*
- Oligo: thousands of exposed servers, many already compromised. By late 2025, a self-propagating campaign.
